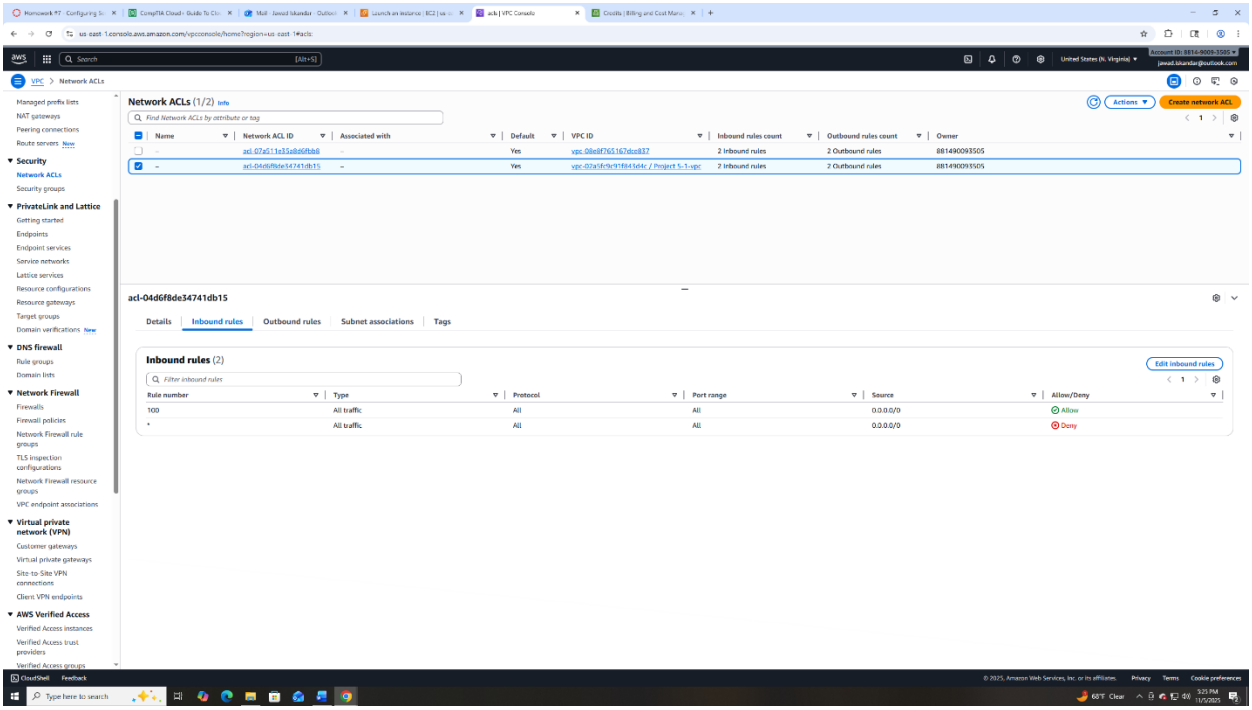
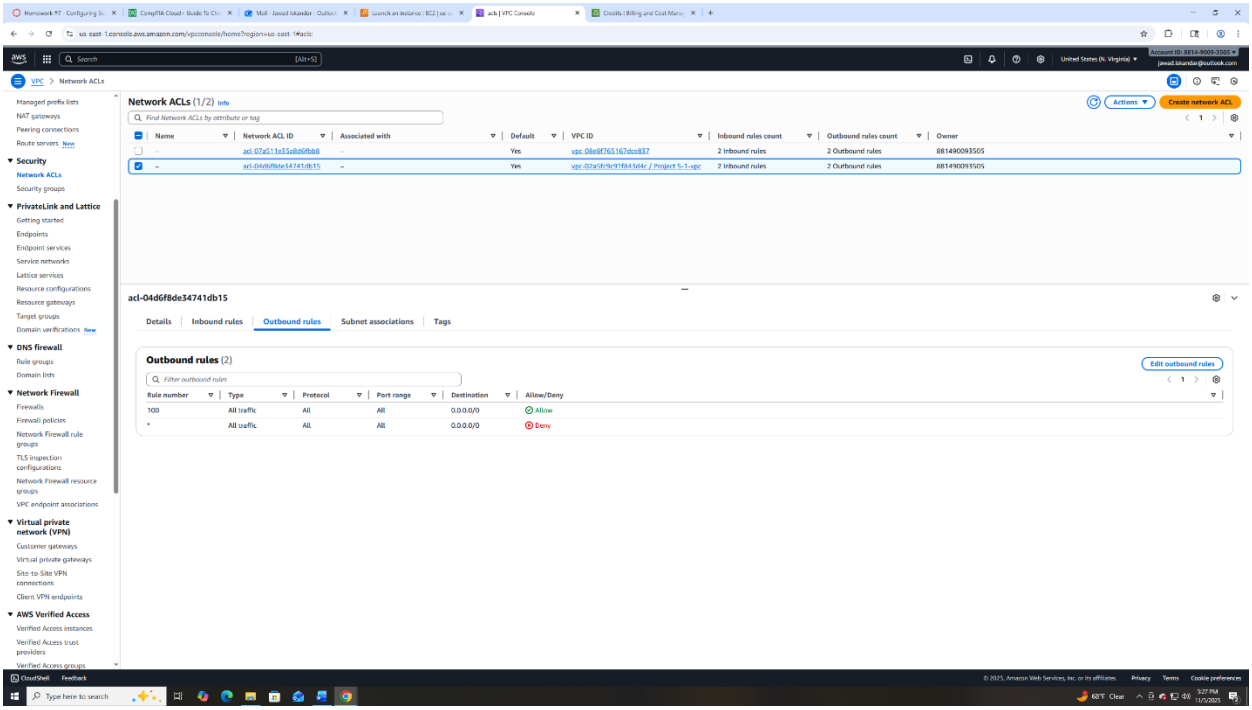
Homework #7 - Configuring Security in AWS

Step 1: Inspect the default NACL (Inbound rules)

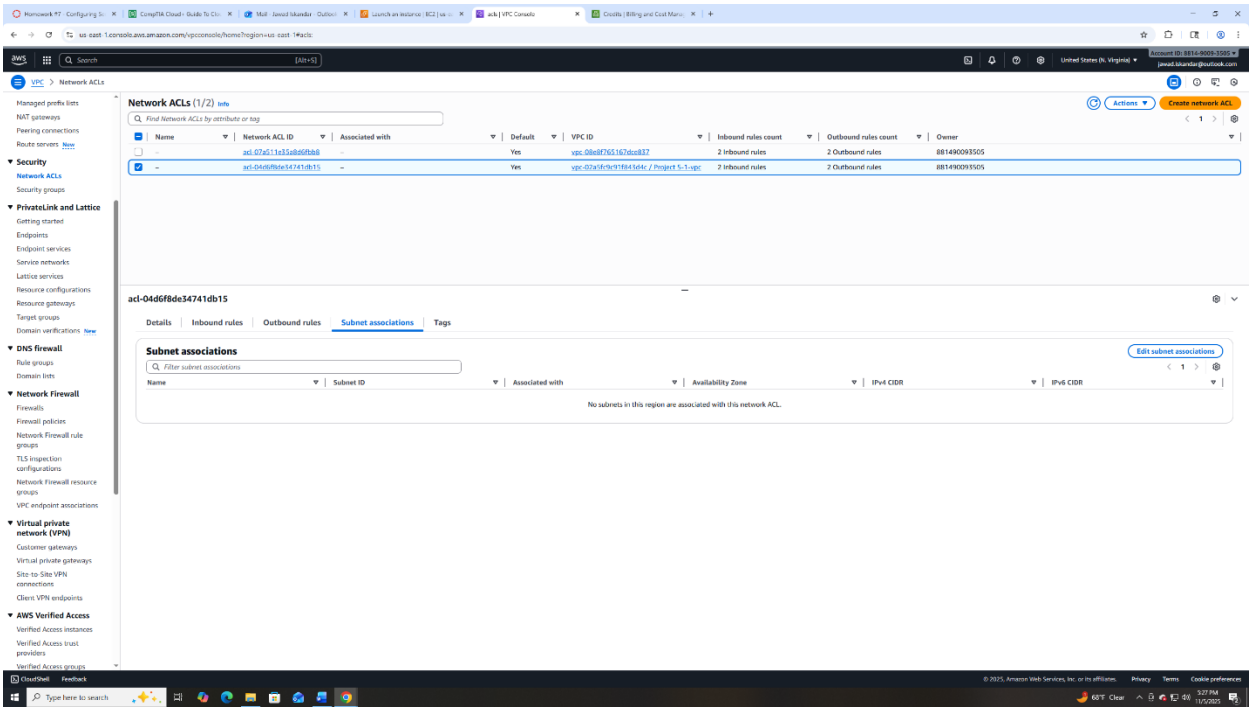


The first matching ALLOW permits traffic; the laterDENY doesn't apply. Effective result: inbound allowed (because of rule order, lowest rule number wins).

Step 2: Check Outbound rules & Subnet associations

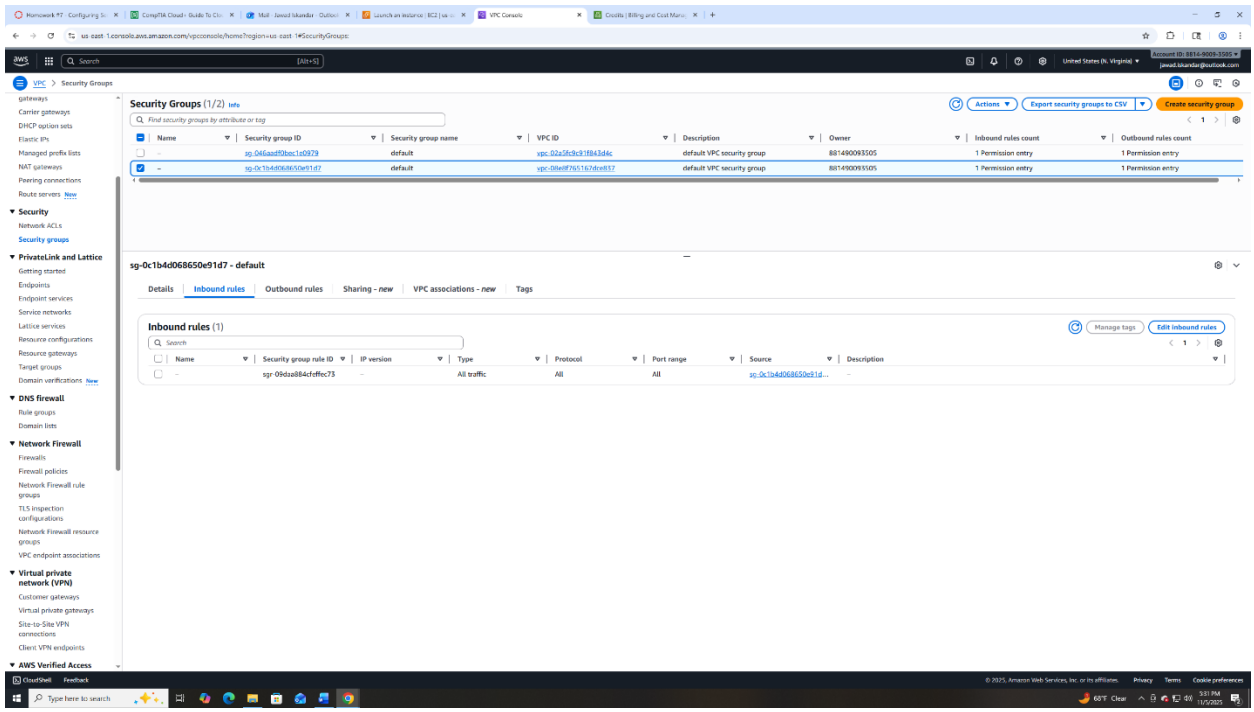


Outbound Rules As seen Above

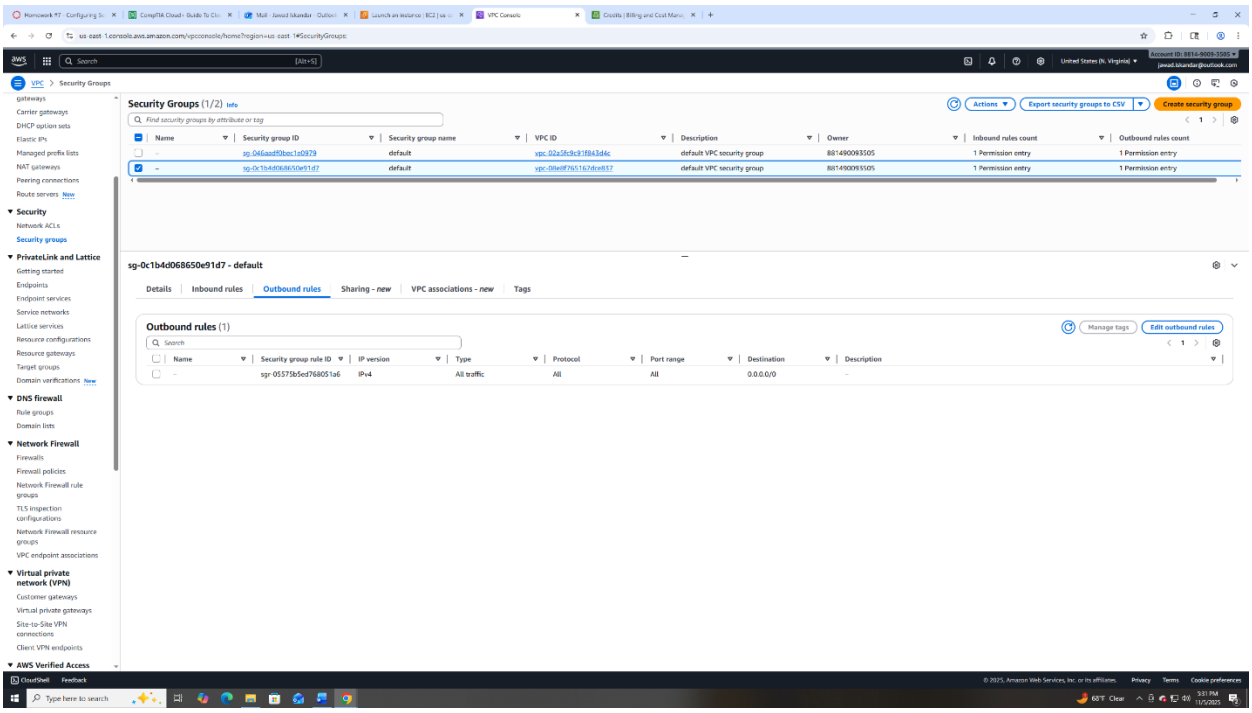


The Subnets number of subnets is 0 Listed

Step 3 — Review the default Security Group



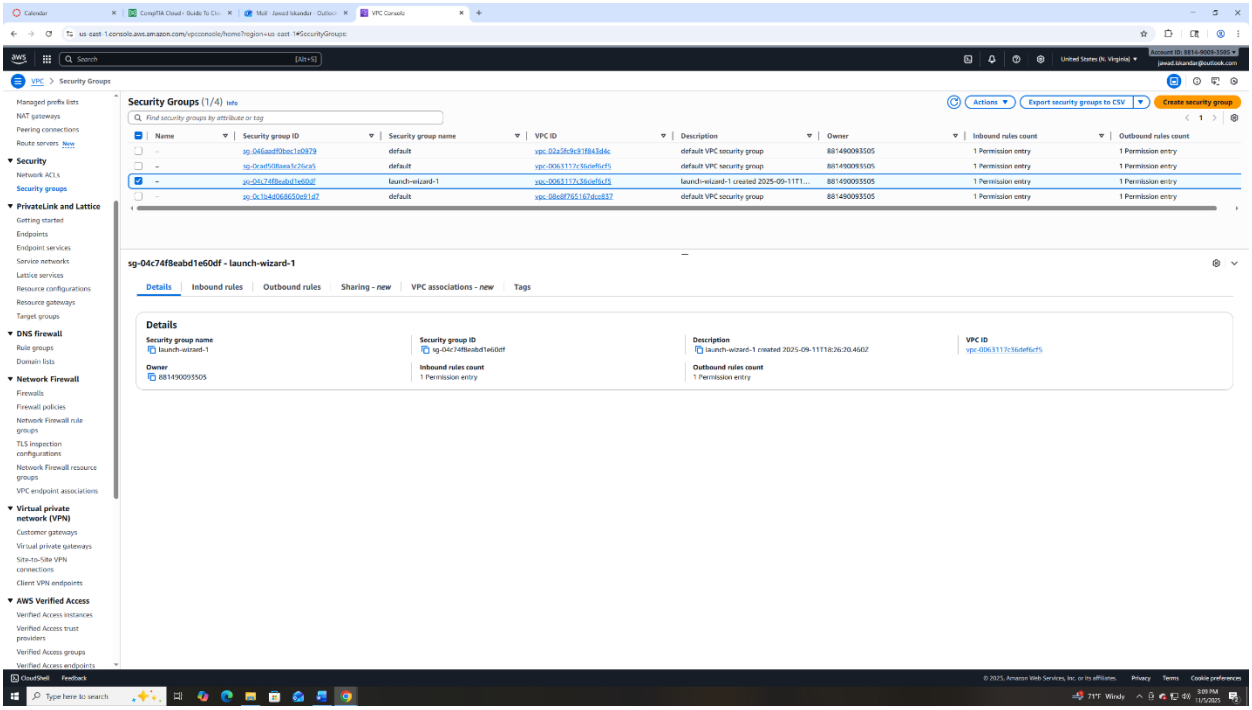
Inbound is the picture above



Outbound is the picture above

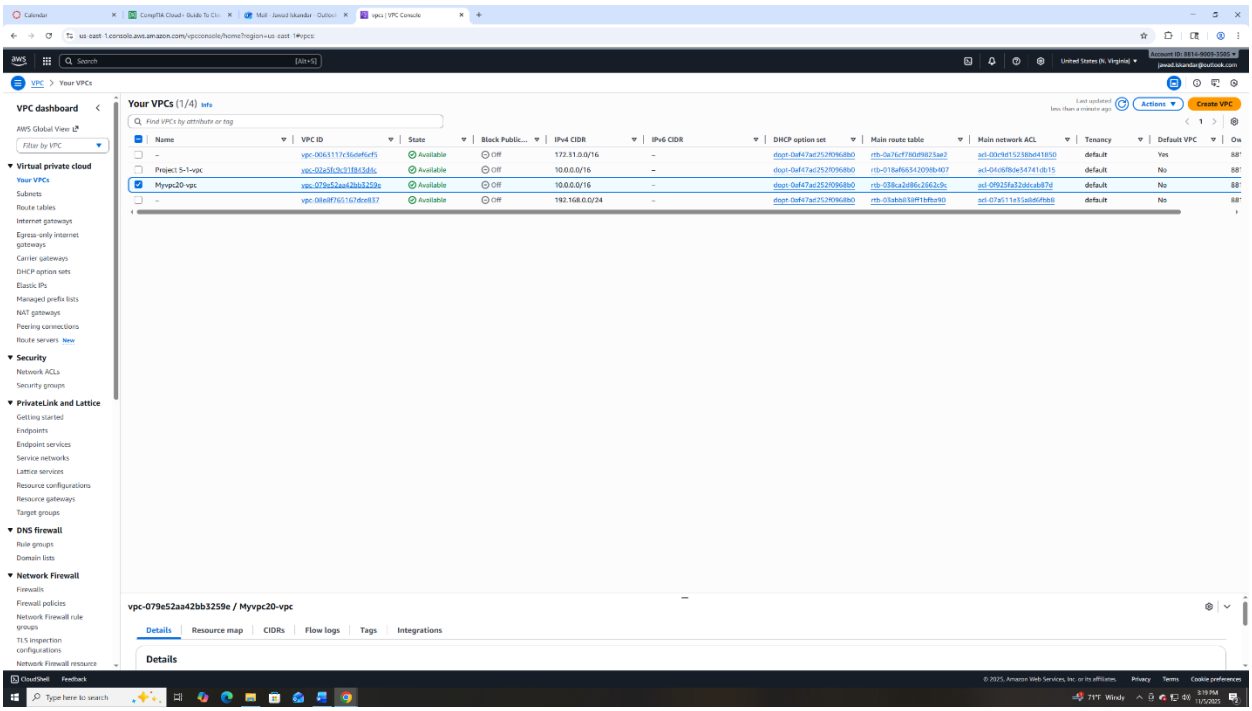
What traffic is allowed? Inbound: only from same SG. Outbound: all traffic. (Anything not referenced is implicitly denied.)

Step 4 — Review a launch-wizard Security Group

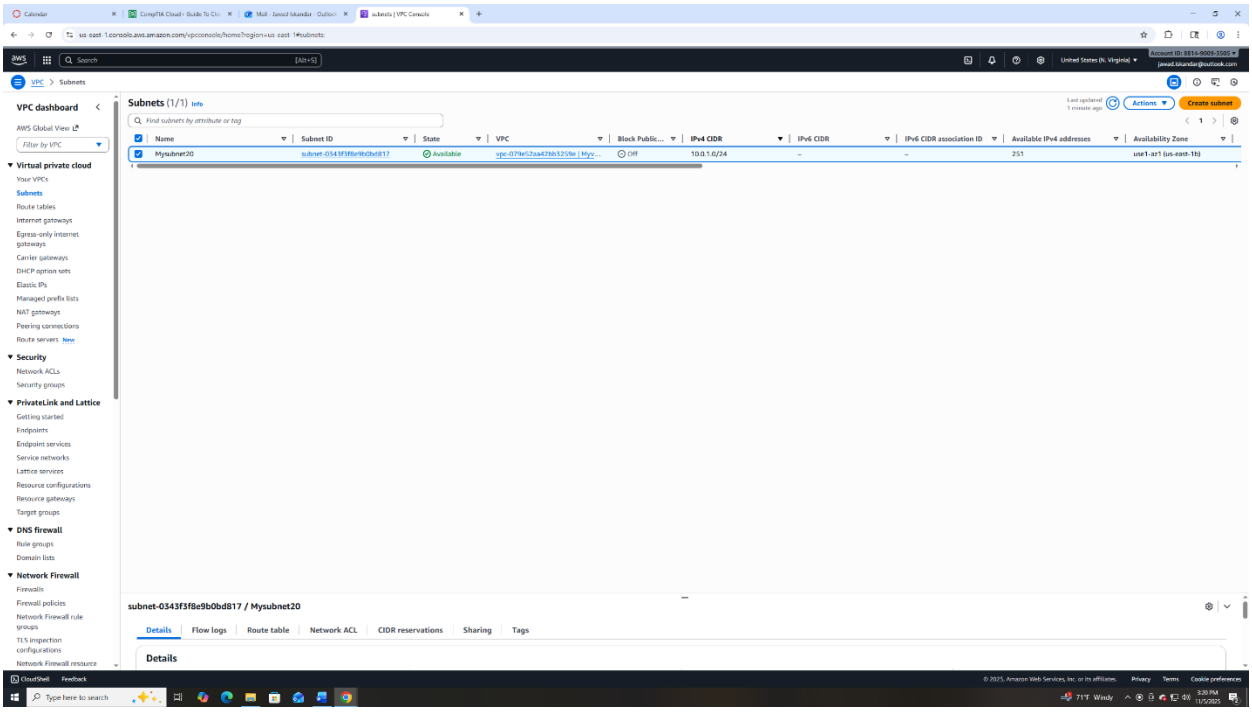


Inbound type & OS guess: If RDP (TCP 3389) → Windows. If SSH (TCP 22) → Linux.

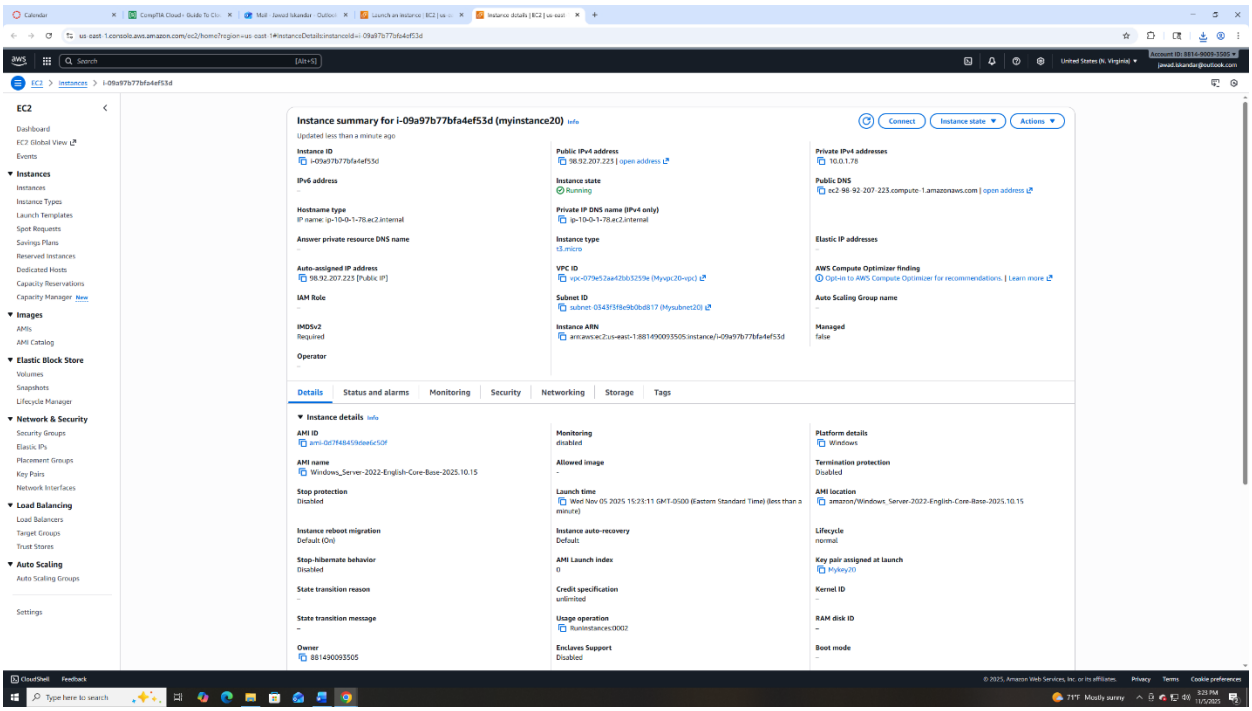
Step 5: Create a new VPC, subnet, and VM (attach default SG of new VPC)



The VPC is created



Subnets is created

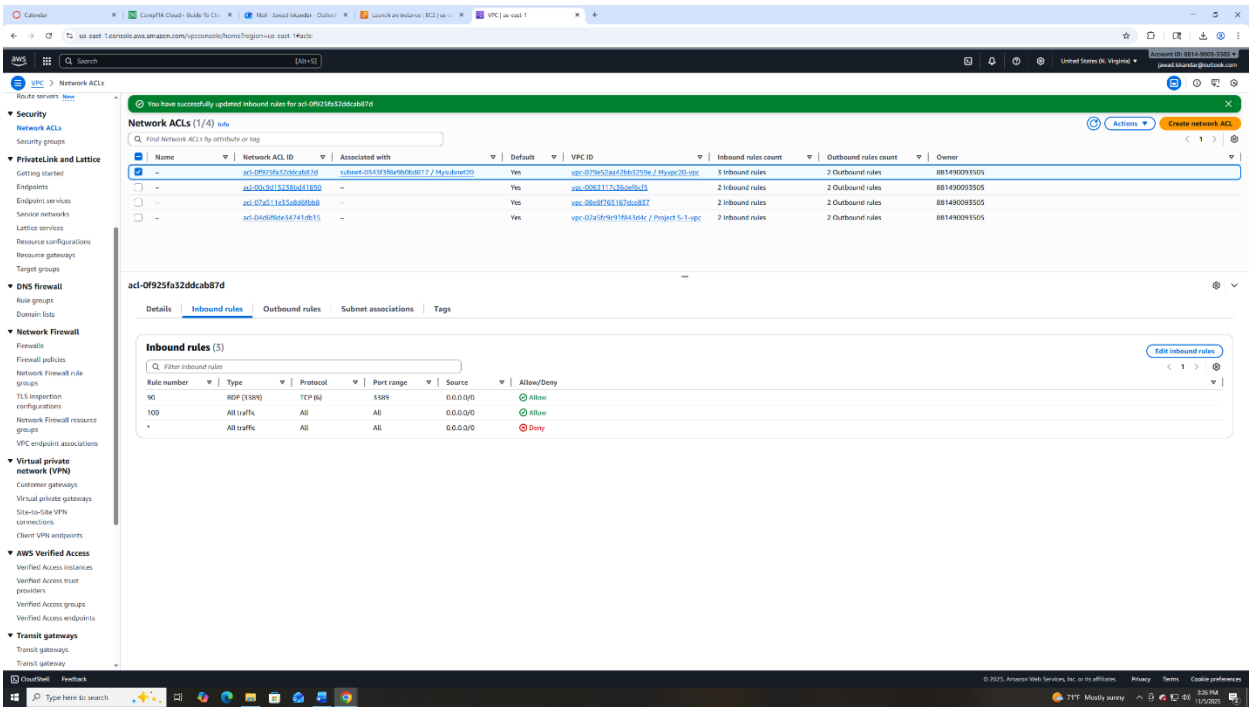


Instance Launched

Step 6 — Review defaults on the new VPC (NACL + default SG)

What's allowed now? NACL: all in/out. Default SG: inbound from itself only, outbound all. Net: instance can reach out, but only receives from same-SG peers (no public RDP/SSH yet).

Step 7 — Add a higher-priority NACL rule for remote access



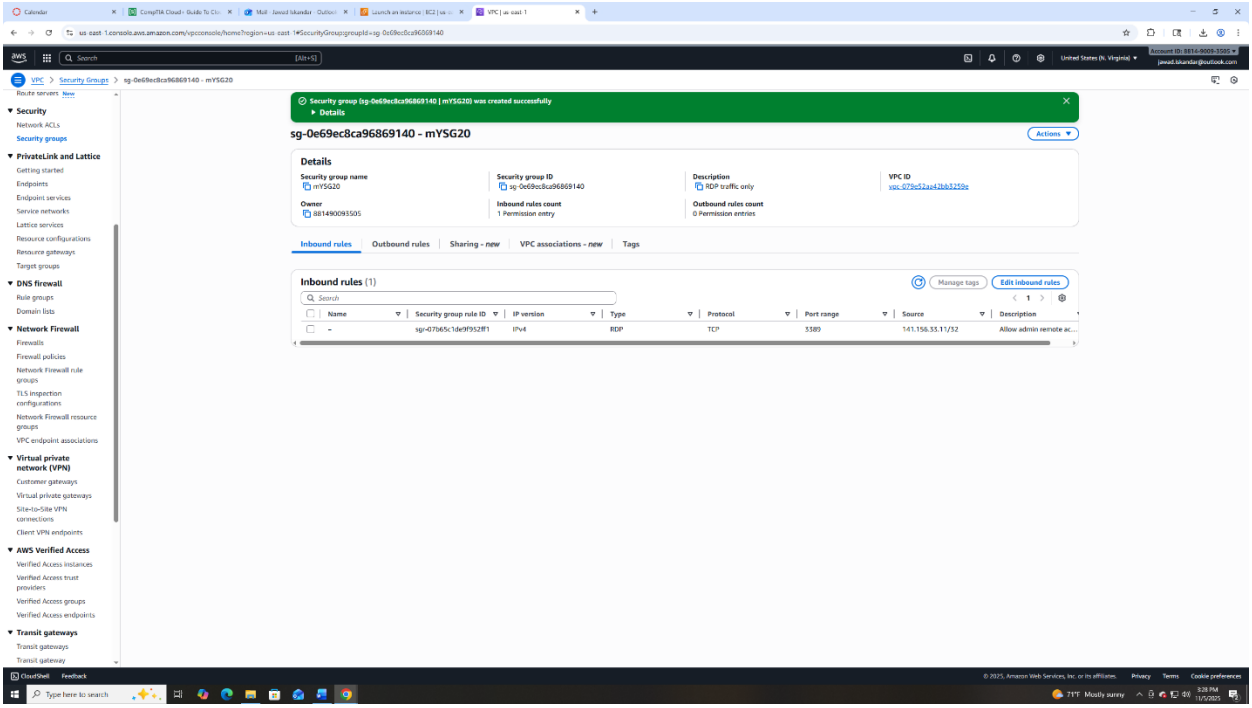
Priority chosen: 90.

Step 8 — Recognize protocols & choose one

Two you recognize: RDP (3389), SSH (22).

Chosen: RDP *(if Windows)* or SSH *(if Linux)*.

Step 9 — Create a tight Security Group that only allows your remote protocol



Security Group Created

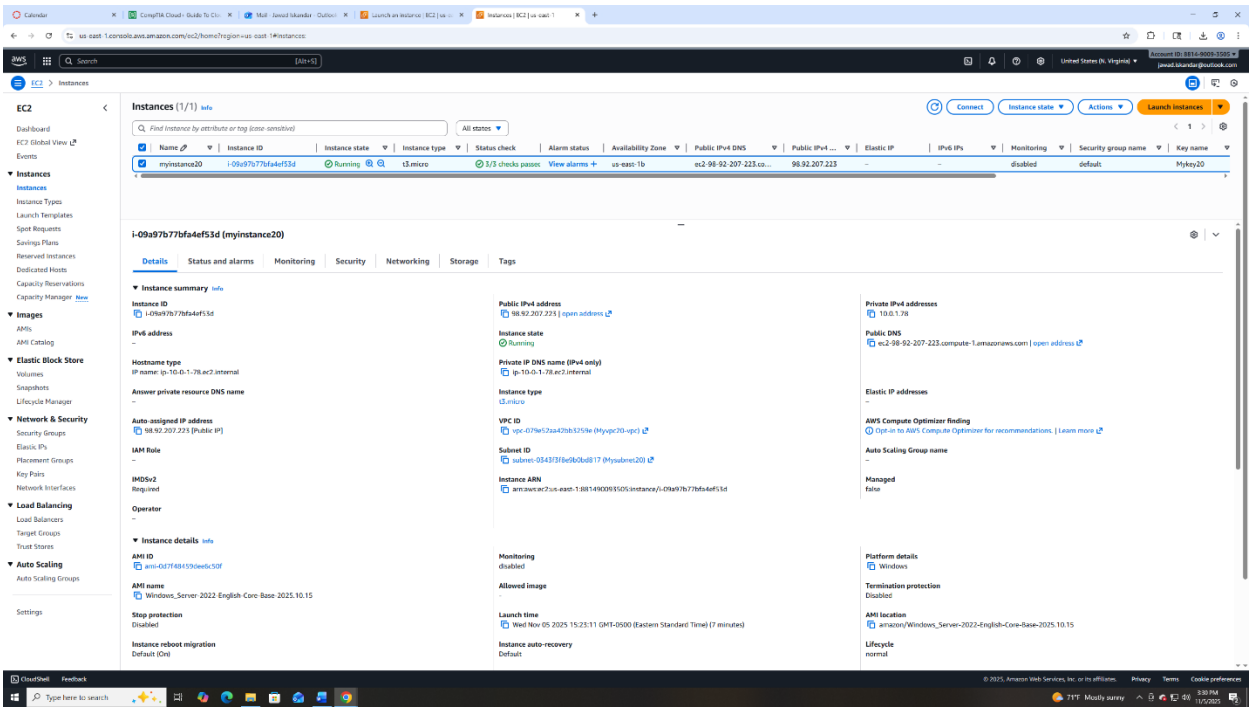
Step 10 — Confirm “My IP” behavior

AWS auto-detects and populates your current public IP, restricting access to only your device.

Step 11 — Add a helpful rule description

Added

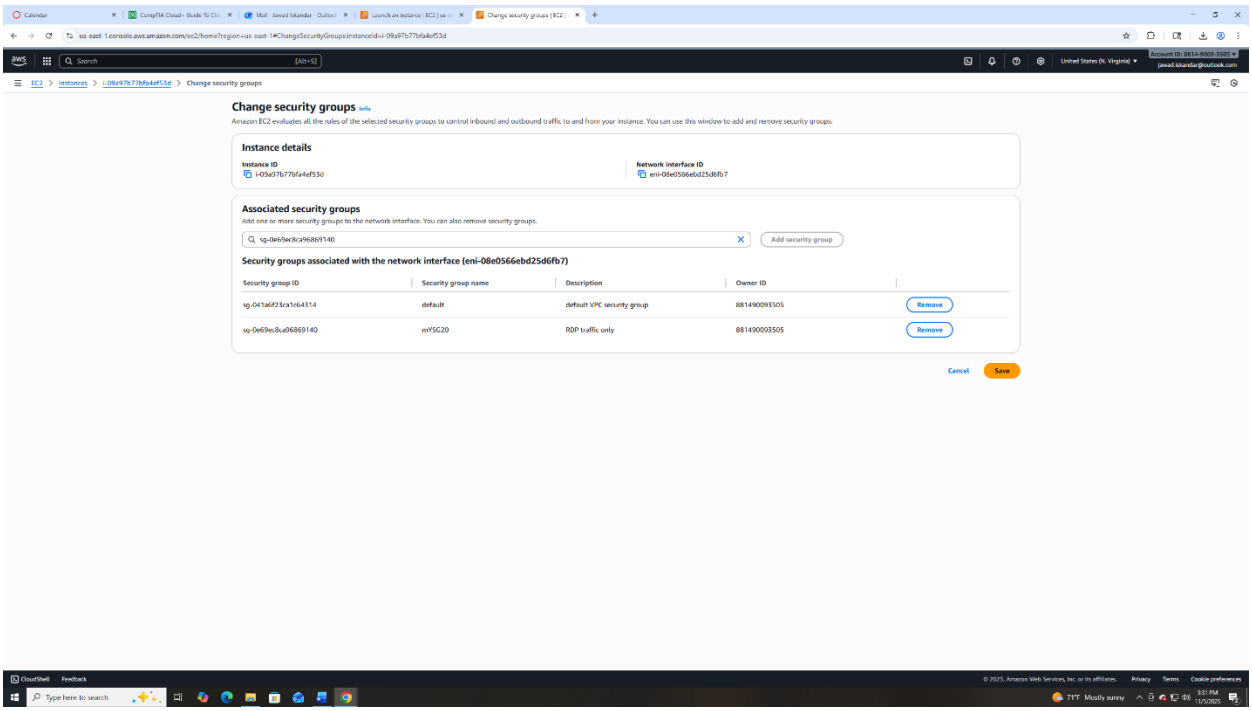
Step 12 — Find the instance’s private IP



Step 13 — Check if it has a public IP (and why)

Public IP present? Why? Yes if Auto-assign public IP was enabled and subnet routes to IGW.

Step 14 / 15 — Identify the instance’s current Security Group

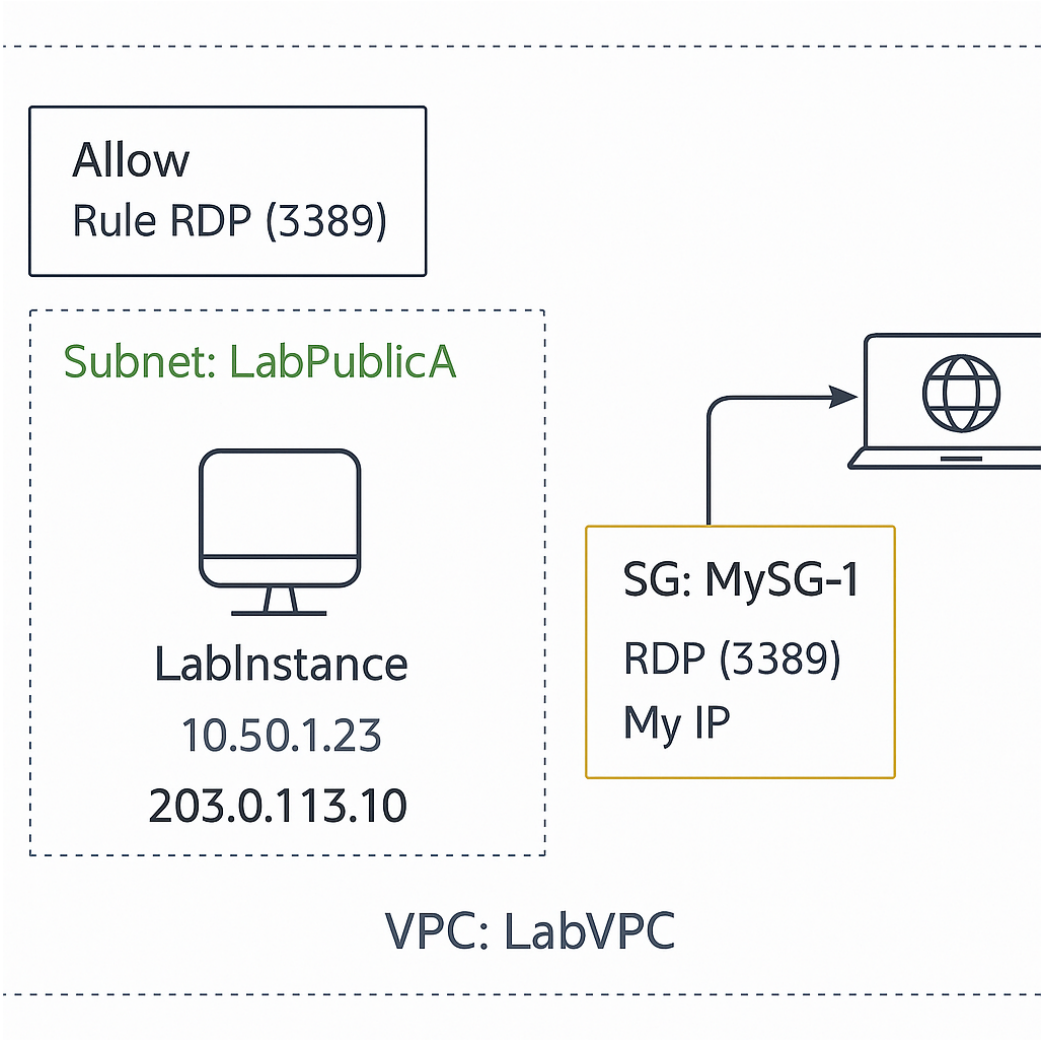


Saved the New security Group

Step 16 — Which security resource can you manage from EC2?

From EC2 Dashboard: Security Groups.
(VPCs/NACLs are managed in the VPC dashboard.)

Diagram



Allow
Rule RDP (3389)
Subnet: LabPublicA
LabInstance
10.50.1.23
203.0.113.10
SG: MySG-1
RDP (3389)
My IP
VPC: LabVPC
